

Production of different tubular forms

The flexibility of our production process allows different applications on the basis of specific requirements.

The management system conforms to ISO 14001:1996 environmental standards

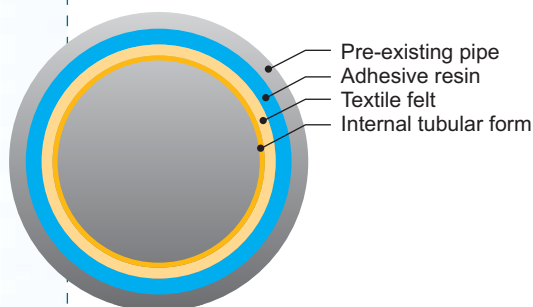

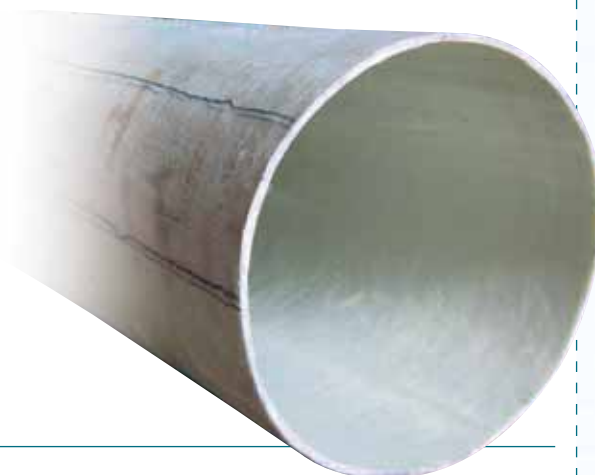

SINCERT

Tubular form reinforced with glass yarns

Tubular form made of felt only

Production

The new equipment in Poviglio, unique of its kind, was conceived to produce all sorts of tubular forms according to different:

- diameter
- thickness
- type of "sandwich"
- type of resin

The Forever Pipe® tubular form:

- Specific design
- Identification and traceability of the product
- Reduced infiltration
- High mechanical properties
- Very good flow characteristics
- High chemical properties
- Suitable for use with potable water
- High abrasion resistance
- No conductivity
- Long term lining life
- Reduced costs

Composition of the ForeverPipe® tubular form

The fabrics, which form the ForeverPipe® hose for the inner relining of pipes, are made up of a waterproof plastic film plus a polyester felt. One or more reinforcement fibre layers of high quality and elevated mechanical properties are combined with this basic fabric. Thus, once the tubular form is inserted into the pipe to reline, it will be possible to make new pipes with such a performance as to stand operating pressure.
